Day 14 – Networking Fundamentals & Hands-on Checks

Task

Get comfortable with core networking concepts and the commands you'll actually run during troubleshooting.

You will:

- Map the **OSI vs TCP/IP models** in your own words
- Run essential connectivity commands
- Capture a mini network check for a target host/service

Keep it short, real, and repeatable.

Expected Output

- A markdown file: `day-14-networking.md`
- Screenshots (optional) of key command outputs

Quick Concepts (write 1–2 bullets each)

- OSI layers (L1–L7) vs TCP/IP stack (Link, Internet, Transport, Application)
- Where IP, TCP/UDP, HTTP/HTTPS, DNS sit in the stack
- One real example: " `curl https://example.com` = App layer over TCP over IP"

Hands-on Checklist (run these; add 1–2 line observations)

- **Identity:** `hostname -I` (Or `ip addr show`) — note your IP.
- **Reachability:** `ping <target>` — mention latency and packet loss.
- **Path:** `traceroute <target>` (Or `tracpath`) — note any long hops/timeouts.
- **Ports:** `ss -tulpn` (Or `netstat -tulpn`) — list one listening service and its port.
- **Name resolution:** `dig <domain>` Or `nslookup <domain>` — record the resolved IP.
- **HTTP check:** `curl -I <http/https-url>` — note the HTTP status code.
- **Connections snapshot:** `netstat -an | head` — count ESTABLISHED vs LISTEN (rough).

Pick one target service/host (e.g., `google.com`, your lab server, or a local service) and stick to it for ping/traceroute/curl where possible.

Mini Task: Port Probe & Interpret

1. Identify one listening port from `ss -tulpn` (e.g., SSH on 22 or a local web app).
2. From the same machine, test it: `nc -zv localhost <port>` (Or `curl -I http://localhost:<port>`).
3. Write one line: is it reachable? If not, what's the next check? (e.g., service status, firewall).

Reflection (add to your markdown)

- Which command gives you the fastest signal when something is broken?

- What layer (OSI/TCP-IP) would you inspect next if DNS fails? If HTTP 500 shows up?
- Two follow-up checks you'd run in a real incident.

Submission

1. Add `day-14-networking.md` to `2026/day-14/`
2. Commit and push to your fork

Learn in Public

Post 2–3 lines on the commands you practiced and one interesting traceroute/curl finding.
