README.md

Day 16 – Shell Scripting Basics

Task

Start your shell scripting journey — learn the fundamentals every script needs.

You will:

- Understand **shebang** (`#!/bin/bash`) and why it matters
- Work with **variables**, **echo**, and **read**
- Write basic **if-else** conditions

Expected Output

- A markdown file: `day-16-shell-scripting.md`
- All scripts you write during the tasks

Challenge Tasks

Task 1: Your First Script

1. Create a file `hello.sh`
2. Add the shebang line `#!/bin/bash` at the top
3. Print `Hello, DevOps!` using `echo`
4. Make it executable and run it

```
chmod +x hello.sh
./hello.sh
```

Document: What happens if you remove the shebang line?

Task 2: Variables

1. Create `variables.sh` with:
 - A variable for your `NAME`
 - A variable for your `ROLE` (e.g., "DevOps Engineer")
 - Print: `Hello, I am <NAME> and I am a <ROLE>`
2. Try using single quotes vs double quotes — what's the difference?

Task 3: User Input with read

1. Create `greet.sh` that:
 - Asks the user for their name using `read`
 - Asks for their favourite tool
 - Prints: `Hello <name>, your favourite tool is <tool>`

Task 4: If-Else Conditions

1. Create `check_number.sh` that:

- Takes a number using `read`
- Prints whether it is **positive**, **negative**, or **zero**

2. Create `file_check.sh` that:

- Asks for a filename
- Checks if the file **exists** using `-f`
- Prints appropriate message

Task 5: Combine It All

Create `server_check.sh` that:

1. Stores a service name in a variable (e.g., `nginx` , `sshd`)
2. Asks the user: "Do you want to check the status? (y/n)"
3. If `y` — runs `systemctl status <service>` and prints whether it's **active** or **not**
4. If `n` — prints "Skipped."

Hints

- Shebang: `#!/bin/bash` tells the system which interpreter to use
- Variables: `NAME="Shubham"` (no spaces around `=`)
- Read: `read -p "Enter name: " NAME`
- If syntax: `if [ condition ]; then ... elif ... else ... fi`
- File check: `if [ -f filename ]; then`

Documentation

Create `day-16-shell-scripting.md` with:

- Each script's code and output
- What you learned (3 key points)

Submission

1. Add your scripts and `day-16-shell-scripting.md` to `2026/day-16/`
2. Commit and push to your fork

Learn in Public

Share your first shell scripts on LinkedIn.
