Day 22 – Introduction to Git: Your First Repository

Task

Today marks the beginning of your Git journey. Git is the backbone of modern DevOps — every tool, pipeline, and workflow revolves around version control. Before diving into advanced concepts, you need to get comfortable with the basics by doing.

You will:

- Understand what Git is and why it matters
- Set up your first Git repository from scratch

- Start building a living document of Git commands

Expected Output

- A local Git repository with a clean commit history
- A file called `git-commands.md` that you will keep updating in future days
- A file called `day-22-notes.md` with your answers

Challenge Tasks

Task 1: Install and Configure Git

1. Verify Git is installed on your machine
2. Set up your Git identity — name and email
3. Verify your configuration

Task 2: Create Your Git Project

1. Create a new folder called `devops-git-practice`
2. Initialize it as a Git repository
3. Check the status — read and understand what Git is telling you
4. Explore the hidden `.git/` directory — look at what's inside

Task 3: Create Your Git Commands Reference

1. Create a file called `git-commands.md` inside the repo
2. Add the Git commands you've used so far, organized by category:
 - **Setup & Config**
 - **Basic Workflow**
 - **Viewing Changes**
3. For each command, write:
 - What it does (1 line)
 - An example of how to use it

Task 4: Stage and Commit

1. Stage your file
2. Check what's staged
3. Commit with a meaningful message
4. View your commit history

Task 5: Make More Changes and Build History

1. Edit `git-commands.md` — add more commands as you discover them
2. Check what changed since your last commit
3. Stage and commit again with a different, descriptive message
4. Repeat this process at least **3 times** so you have multiple commits in your history
5. View the full history in a compact format

Task 6: Understand the Git Workflow

Answer these questions in your own words (add them to a `day-22-notes.md` file):

1. What is the difference between `git add` and `git commit` ?
2. What does the **staging area** do? Why doesn't Git just commit directly?
3. What information does `git log` show you?
4. What is the `.git/` folder and what happens if you delete it?
5. What is the difference between a **working directory**, **staging area**, and **repository**?

Ongoing Task

Keep updating `git-commands.md` **every day** as you learn new Git commands in the upcoming days. This will become your personal Git reference. Maintain a clean commit history — one commit per update with a clear message.

Hints

- All you need today are about 8-10 Git commands — Google them, try them, break things
- Read what `git status` tells you — it's your best friend
- Use `man git-<command>` or `git <command> --help` to explore

Submission

1. Share a screenshot of your `git log --oneline` output showing multiple commits
2. Add your `day-22-notes.md` to `2026/day-22/`
3. Commit and push to your fork
4. Add your submission for Community Builder of the week on discord

Share your first Git repo and commit history on LinkedIn.
