Day 02 – Linux Architecture, Processes, and systemd

Task

master

90DaysOfDevOps / 2026 / day-02

↑ Top

You will create a short note that explains:

- The core components of Linux (kernel, user space, init/systemd)
- How processes are created and managed
- What systemd does and why it matters

This is the foundation for all troubleshooting you will do as a DevOps engineer.

Expected Output

By the end of today, you should have:

- A markdown file named:
`linux-architecture-notes.md`

or

- A hand written set of notes (Recommended)

Your notes should be clear enough that someone new to Linux can follow them.

Guidelines

Follow these rules while creating your notes:

- Explain **process states** (running, sleeping, zombie, etc.)
- List **5 commands** you would use daily
- Keep it **short and practical** (under 1 page)
- Use bullet points and short headings

Resources

You may refer to:

- Linux man pages (`ps` , `top` , `systemctl`)
- Official systemd docs
- Your class notes

Avoid copying/pasting AI Generated content. Focus on understanding.

Why This Matters for DevOps

Linux is the base OS for almost every production system.

If you know how processes and systemd work, you can:

- Debug crashed services faster
- Fix CPU/memory issues

- Understand logs and service restarts confidently

This knowledge saves hours during incidents.

Submission

1. Fork this `90DaysOfDevOps` repository
2. Navigate to the `2026/day-02/` folder
3. Add your `linux-architecture-notes.md` file
4. Commit and push your changes to your fork

Learn in Public

Share your Day 02 progress on LinkedIn:

- Post 2–3 lines on what you learned about Linux internals
- Share one `systemd` command you found useful
- Optional: screenshot of your notes

Use hashtags: `#90DaysOfDevOps` `#DevOpsKaJosh` `#TrainWithShubham`

Happy Learning
