Day 08 – Cloud Server Setup: Docker, Nginx & Web Deployment

Task

Today's goal is to **deploy a real web server on the cloud** and learn practical server management.

You will:

- Launch a cloud instance (AWS EC2 or Utho)
- Connect via SSH
- Install Nginx
- Configure security groups for web access (port 80 by default for nginx)
- Extract and save logs to a file

- Verify your webpage is accessible from the internet

This is real DevOps work - exactly what you'll do in production.

Expected Output

By the end of today, you should have:

1. A markdown file named: `day-08-cloud-deployment.md`
2. Screenshots showing:
 - SSH connection to your server
 - Nginx welcome page accessible from browser
 - Log file contents
3. The log file: `nginx-logs.txt`

Prerequisites

- AWS account (Free Tier) OR Utho account
- Basic understanding of Linux commands (Days 1-7)
- SSH client (Terminal on Mac/Linux, PuTTY on Windows)

Guidelines

Part 1: Launch Cloud Instance & SSH Access (15 minutes)

Step 1: Create a Cloud Instance

Step 2: Connect via SSH

Part 2: Install Docker & Nginx (20 minutes)

Step 1: Update System

Step 3: Install Nginx

Verify Nginx is running:

Part 3: Security Group Configuration (10 minutes)

Test Web Access: Open browser and visit: `http://<your-instance-ip>`

You should see the **Nginx welcome page!**

📸 Screenshot this page - you'll need it for submission

Part 4: Extract Nginx Logs (15 minutes)

Step 1: View Nginx Logs

Step 2: Save Logs to File

Step 3: Download Log File to Your Local Machine

```
# On your local machine (new terminal window)
# For AWS:
scp -i your-key.pem ubuntu@<your-instance-ip>:~/nginx-logs.txt .

# For Utho:
scp root@<your-instance-ip>:~/nginx-logs.txt .
```

Documentation Template

Create your `day-08-cloud-deployment.md` with this structure:

Commands Used

[List the key commands you used]

Challenges Faced

[Describe any issues and how you solved them]

What I Learned

[3-5 bullet points of key learnings]

Why This Matters for DevOps

This exercise teaches you:

- **Cloud infrastructure provisioning** - launching and configuring servers
- **Remote server management** - SSH, security, access control
- **Service deployment** - installing and running applications
- **Log management** - accessing and analyzing logs
- **Security** - configuring firewalls and security groups

These are core skills for any DevOps engineer working in production.

Submission

1. Fork this `90DaysOfDevOps` repository
2. Navigate to the `2026/day-08/` folder
3. Add your `day-08-cloud-deployment.md` file
4. Add your `nginx-logs.txt` file
5. Add screenshots (name them: `ssh-connection.png` , `nginx-webpage.png` , `docker-nginx.png`)
6. Commit and push your changes to your fork

Learn in Public

Share your Day 08 progress on LinkedIn:

- Post 2-3 lines on deploying your first cloud server
- Share screenshot of your Nginx webpage
- Mention one challenge you faced and solved
- Optional: Share your instance IP (if comfortable)

Use hashtags:

#90DaysOfDevOps
#DevOpsKaJosh
#TrainWithShubham
